NUUK Technologies, a subsidiary of RPG (www.rpg.es/en), was created by RPG at the end of 2020 as part of its strategic vision to drive innovation in multimedia orchestration for mission-critical environments. NUUK was established to develop cutting-edge solutions that enhance collaborative decision-making in geographically distributed Command & Control (C&C) Centers, with the goal of reducing response times and increasing operational efficiency.

Since its inception, NUUK has focused on intensive R&D efforts, participating in major Spanish and European innovation programs. These include projects such as Respond-A, SecurIT, and MC-SEAL, reflecting RPG's broader commitment to advancing public safety technologies.

NUUK Technologies

NUUK's flagship product, **Flexcontrol**, is a powerful and scalable software platform tailored for distributed Command & Control operations. It supports the integration and management of diverse media sources across multiple device types—ranging from smartphones and tablets to desktops and high-performance Control Center videowalls. **Flexcontrol** facilitates seamless communication between field agents, operators, and decision-makers, enabling faster, more informed responses in critical scenarios.

Flexcontrol is a unique solution that facilitates the extension of the Control Center's reach by making critical information—normally confined to the Control Center—accessible on mobile devices such as smartphones and tablets in the field. It also enables citizen engagement, allowing individuals to support emergency operations by streaming real-time video directly from their personal devices.

Deployed across numerous public safety agencies, **Flexcontrol** has been successfully implemented by clients including the San Sebastian Police, Valencia Police, Basque Country Regional Police, Catalonia Regional Police, Galicia 112, Balearic Islands 112, Castilla-La Mancha Firefighters, and the Lithuanian Police, among others.
